About Polygons In Engineering Drawing

The sides of a regular polygon will be

tangential to the circle drawn inside. The sum of the interior angles of a polygon is equal to $(n - 2) \times 180°$ where n is the number of sides. The sum of exterior angles of a polygon is equal to $360°$. The sum of the interior angle and the corresponding external angle is $180°$.

About Polygons In Engineering Drawing

1. Get an idea of what polygon you want to draw. There are many different types of polygons. Polygons are usually classified by the number of sides they have. For example, a pentagon has five sides, a hexagon

has six, and an octagon has eight. Mathematicians use the term "n-gon" to refer to a polygon with "n" sides.

How to draw POLYGON -draw any polygon by using 1 method

Inscribe a regular polygon of any number of sides (say n = 5), in a circle. Draw the circle with diameter AB. Divide AB in to "n" equal parts Number them. With center A & B and radius AB, draw arcs to intersect at P. Draw line P2 and produce it to meet the circle at C. AC is the length of the

side of the polygon.

Engineering Drawing- Regular Polygon

Since a circle has 360°, divide 360° by n, the number of vertices (or sides) to get ?. ?=360°/n. ? is the measured angle between lines drawn from the center of the circle to adjacent vertices. For a dodecagon, n =12. A

dodecagon has 12 sides and 12 vertices, so 360° divided by 12 is 30°, and ?=30°.
