the CMOS/APS imager sensors or smart retinas (known as intelligent sensors) as a finite state machine (FSM) giving microprocessor instruction to an SMD device. Such microprocessors support various operating systems and communication drivers. This suggests that it should be possible to associate a CMOS Retina with a low cost micro processor or micro-

CCD Sensors Have One Readout In Corner, CMOS Sensors Have Readout at Each Pixel. By incorporating all these electronics into the sensor, the chip itself is made much more complex, but the camera is greatly simplified. CCD sensors only have one, two, or sometimes four readouts – potentially one in each corner. CMOS sensors have thousands.

An active-pixel sensor (APS) is an image sensor where each pixel sensor unit cell has a photodetector (typically a pinned photodiode) and one or more active transistors. In a metal-oxide-semiconductor (MOS) active-pixel sensor, MOS field-effect transistors (MOSFETs) are used as amplifiers. There are different types of APS, including the early NMOS APS and the much more common complementary ...
