provide revisions and updates in their individual field of study offering readers current data and information on the rapidly changing subjects in molecular biology.

The Second Edition of Lewin's Essential GENES continues to provide students with the latest findings in the field of molecular biology and molecular genetics. An exceptional new pedagogy enhances student learning and helps readers understand and retain key material like never before. New Concept and Reasoning Checks at the end of each chapter section, End of Chapter Questions and Further Readings for each chapter, and several categories of special topics boxes within each chapter expand and reinforce important concepts. The

reorganization of topics in this edition allows students to focus more sharply on the key material at hand and improves the natural flow of course material. New end-of-chapter questions reviews major points in the chapter and allow students to test themselves on important course material. Molecular Biology is a rapidly advancing field with a constant flow of new information and cutting-edge developments that impact our lives. Lewin's GENES has long been the essential resource for providing the teaching community with the most modern presentation to this dynamic area of study. GENES XI continues this tradition by introducing the most current data from the field, covering gene structure, sequencing, organization, and expression. It has enlisted a wealth of subject-matter experts, from top institutions, to provide content updates and revisions in their individual areas of study. A reorganized chapter

The last two decades have seen a revolution in Bordeaux. What Price Bordeaux? takes a novel approach in explaining the forces responsible for this change. The top chateaux have been obtaining unprecedented prices for their wines, while at the same time smaller chateau owners are going bankrupt. Enormous changes in the production and style of wine have been accomplished by advances in viticulture and vinification coupled with climatic changes. The battle between modernists and traditionalists plays out through the garage wines, felt by some to be the newest wave, and by others to be a caricature of Bordeaux. Pulling together information from a variety of sources including the market in

Bordeaux, changing patterns of ownership, and new possibilities in viticulture and vinification, this book presents a unique overview of the forces making Bordeaux wine what it is today. The book considers the role of terroir, how events ranging from the phylloxera plague to global warming have changed the fundamental nature of Bordeaux, the mysteries of the en primeur system, the rising influence of oenologues and critics, the changing nature of the wine itself, and the rise and fall of various chateaux. A running theme is the powerful effect that the classification of 1855 continues to have on the chateaux of both Left and Right Banks, and this and the other classification systems are considered before concluding with a new classification of the chateaux based

on the existing market.

Genes quickly established itself as one of the foremost teaching resources in modern biology following its first publication in 1983. It has retained that position through two further editions (1985 and 1987). It was the first textbook to provide a unified view of the molecular biology of prokaryotes (bacteria) and eukaryotes (higher organisms - animals and plants) but this integrated view has always been supported by descriptions of the approaches that the researchers are currently using, making it the most consistently up-to-date account of

the rapid advances which have been made in this field during the 1980s. The purpose of this book is to give an account of what is known about the structure and function of genes in both eukaryotes and prokaryotes. The author provides a authoritative, consistent discussion of the complex biochemical and genetic answers to some crucial questions. What is a gene? How is it reproduced? How are its characteristics conceived or modified within individuals or over evolutionary time? How is it expressed? What controls expression? In effect it covers the ground that now constitutes the core of any modern course in genetics or biochemistry above the most elementary level.
